Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance: The invention relates to an audio visual media encoding system. Preferably, the present invention may be adapted to encode videoconferences, Seminars or presentations made over computer network for review by an observer, either in real time or a latter time.

The prior art of record in combination or alone fails to teach or suggest these elements of independent claims 37, 47, 63-64, 66-67, 70-74 in combination with other elements. For example, independent claim 37 has claim limitations such as configuring the recording apparatus as a participant in the videoconference, receiving, at the recording apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one protocol signal, and reading, at the recording apparatus, one or more protocol signals from the computer network pertaining to the videoconference transmission, and applying, at the recording apparatus, a selected encoding process to a received audio visual signal to generate an encoded videoconference, the encoding process being selected depending on the contents of the at least one protocol signal read, storing the selected encoded videoconference in a memory device associated with the recording apparatus, and outputting, at the recording apparatus, the encoded videoconference stored in the memory device to a reproduction device through the computer network. Independent claim 47 has claim limitations such as receiving, at the encoding apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one

Art Unit: 2614

protocol signal, and reading, at the encoding apparatus, one or more protocol signals, applying at the encoding apparatus, a selected encoding process to a received audio visual signal, the encoding process being selected depending on the contents of the at least protocol signal read, wherein the content of a read protocol signal is used to detect the time position of at least one key frame present within an audio visual signal of the videoconference transmission, and encoding key frames into an encoded output at a same time position as key frames are detected in an audio visual signal of the videoconference transmission. Independent claim 63 has claim limitations such as receiving, at the encoding apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one protocol signal, and reading, at the encoding apparatus, one or more protocol signals, and determining, at the encoding apparatus, a time position of a first keyframe present within an audio visual signal received, and encoding, at the encoding apparatus, a second keyframe into an encoded output at a same time position at which the first keyframe was detected in an originally received audio visual signal.

Independent claim 64 has claim limitations such as receiving, at the encoding apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one protocol signal, and reading, at the encoding apparatus, one or more protocol signals, and detecting, at the encoding apparatus, a content switch within the audio visual content of a received audio visual signal or signals, and encoding, at the encoding apparatus, a index marker at a time position at which content switch was detected.

Art Unit: 2614

Independent claim 66 has claim limitations such as receiving, at the encoding apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one protocol signal, and reading, at the encoding apparatus, one or more protocol signals, and detecting, at the encoding apparatus, a content switch within the audio visual content of a received audio visual signal, encoding, at the encoding apparatus, a keyframe, and encoding, at the encoding apparatus, an index marker at a same time position or adjacent to the time position of the keyframe encoded. Independent claim 67 has claim limitations such as receiving, at the encoding apparatus, a videoconference transmission from a computer network, the videoconference transmission including at least one audio visual signal and at least one protocol signal, and reading, at the encoding apparatus, one or more protocol signals, and detecting, at the encoding apparatus, an existence of a low content state present within a received audio visual signal or signals, and time compressing, at the encoding apparatus, the encoded output content during a time period in which low content state is detected within the videoconference transmission received. Independent claim 70 recites apparatus for implementing claim 37. Independent claim 71 recites an apparatus for for implementing claim 63. independent claim 72 recites an apparatus for implementing claim 64. independent claim 73 recites an apparatus for implement claim 66. independent claim 74 recites an apparatus for implementing claim 67. for the above reasons independent claims 37, 47, 63-64, 66-67, 70-74 and their dependent claims are allowable.

2. Claim 37-39, 45-68, 70-74, 76-80 are allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Melur Ramakrishnaiah whose telephone number is (571)272-8098. The examiner can normally be reached on 9 Hr schedule.
